

PRESS RELEASE
20.01.2022

The IAM.cloud solution is already available in Poland

QDP Sp. z o.o. signed a partnership agreement with IPG Group - a pioneer and expert in Identity Governance and Administration Management, offering a comprehensive and innovative approach to IAM to all organizations around the world.

QDP Sp. z o.o., as a representative of IPG Group in Poland, diversifies its offer portfolio with an innovative solution for identity and access management based on the cloud: IAM.cloud. It is a modern IDaaS (Identity as a Service) cloud solution introduced to support the most important IAM processes in organizations. As a part of the partnership, QDP is accountable for providing implementation, service and technical support for IAM.cloud on Polish market.

IAM.cloud is a cloud-based innovative solution that automates and facilitates the management of all relevant IAM processes in an organization. The IAM.cloud operates in the Microsoft Azure Cloud and incorporates all benefits of IDaaS and a flexible On-Prem solution.

Based on best practices, IAM.cloud provides full control and management of IAM processes in an organization: management of the identity and user accounts lifecycles, authorizations as well as an access to data and applications. IAM.cloud distinguishes an innovative approach to IAM - due to implementation, the organization acquires a solution with all basic functions and processes preconfigured in the cloud (compliance, governance, standard connectors e.g. AD, Exchange, LDAP, SAP).

Time and money saver

The IAM.cloud is offered as a SaaS - a fixed license fee facilitates cost management and budget planning, and the investment itself is included in the client's operating costs. As a result, the total cost of ownership (TCO) as well as the time to value (TTV) are reduced. Moreover, to manage the entire IAM system, there is no need of any specialist knowledge or new post recruitment. The complete support related to the implementation and operation of IAM.cloud is provided by QDP.

Deciding on IAM.cloud, organizations do not need to maintain, upgrade or replace IAM hardware and technology - they receive constant updates, patches, system monitoring, new features, and ongoing technical support. Thus, it automates and facilitates identity and access management in an organization and significantly reduces costs. By implementing IAM.cloud, organizations do not need internal resources or their own IT infrastructure to support IAM processes, which makes the entire implementation process several times faster compared to traditional IAM solutions.

Increased security

Improperly and insufficiently managed and controlled IAM processes are a major threat to organization's security and can constantly lead to non-compliance. IAM.cloud ensures more security and fulfills all requirements of compliance. All users are authenticated and authorized according to the policies and roles set by an organization. IAM.cloud is an extension of client's infrastructure with comprehensive IAM functions. The solution is based on proven and standardized technologies (containerization with Kubernetes), and all operations are safe. Customer data is separated (each customer receives its own dedicated instance), and separate authentication and encryption mechanisms of customer's instance are provided by the Azure technology (AES256). Customer data is recorded and stored in accordance with applicable local laws and regulations.

The identity management process has become considerably complex in an organization. Moving traditional IT infrastructure to the cloud increases the need for secure and flexible identity and access management in all companies. In addition, the growing number of cyber threats, with identity becoming the target of cyberattackers, makes IAM now critical to cybersecurity. IAM.cloud is distinguished by a modern and comprehensive approach to IAM. The solution automates and facilitates identity and access management, increases level of cybersecurity and brings measurable financial benefits to organizations. IAM.cloud provides a comprehensive set of tools that, based on best practices, allow to securely manage accounts and access in every organization.

QDP Sp. z o.o. (formerly *Quest-Dystrybucja Sp.z o.o.*) - provider of IT solutions, integrating comprehensive systems in the areas of operations management, IT development and cybersecurity. A representative of market-leading software producers: ApiOmat / Easy Software, Broadcom, Cymulate, Secret Double Octopus, InfoBay, Sasa Software, SMA, Micro Focus, IPG Group, Yubico and a Platinum Plus partner of One Identity and Quest Software. Due to a direct cooperation with producers, the company provides significant support in the implementation and use of the offered software. The wide range of QDP products includes solutions that simplify the management of databases and Microsoft infrastructure, optimize and improve the efficiency of hybrid environments, improve level of cybersecurity and security of access to information, and automate business processes. www.qdp.com.pl

IPG Group has been a pioneer and expert in the field of identity and governance management for more than 20 years. Well-known customers from all industries - as well as public administration organizations in Switzerland, Germany and Austria - rely on the service and expertise of IPG for comprehensive protection of user data and access rights. For this purpose, IPG is the preferred partner of major software manufacturers. In 2020 the company generated sales of EUR 21 million and has successfully implemented over 1000 projects since 2001. The IPG Group has been part of the TIMETOACT Group since the beginning of 2021 and employs 130 people in the DACH region. www.ipg-group.com
